

Clear Computing and StreetEagle Send Route Updates to Garmin in Vehicle

January 28, 2008

Tinton Falls, NJ - Drivers using a Garmin for visual and verbal driving directions can now get immediate updates to their routes while on the road, using the latest technology from Clear Computing and Insight-USA.

Updates of the day's work are sent to the Garmin device in your company vehicle equipped with **StreetEagle GPS**, from the office computer running Clear Computing's **Total Activity Control (TAC)** operations management system. With this technology, businesses can respond quickly to route changes, which are opportunities for **increased revenue per driver** and **reduced road and driver costs**.

Fixed Service Routes

Drivers can be anywhere at start of day to receive their fixed service routes in their Garmin device. The driver then gets visual and verbal driving instructions for the route (multiple languages supported). Combine this with an emailed copy of the service route, supported in TAC, and your service trucks can start the day from any location with all the information they need.

Work Order Dispatching

For companies using work orders, the TAC system will send the work order list or the next work order to the vehicle, and the Garmin device will take the driver from the current location to the service location(s) in the order you specify. No phone calls, no time lost writing down instructions, and the directions are **optimized** to minimize driving time and distance. If written forms are needed for customer signature and driver notation, TAC will email full color PDFs to the driver who can print locally.

Quick Response to Route Changes

Route updates due to additions or changes to a driver's work for the day are optimized and sent to the driver's Garmin.

"This is a real productivity enhancement for service industries," said Joel Smith, Clear Computing's Chief Technology Officer. "This is made possible due to our seamless integration with other products, which reduces clerical effort, improves communication, and boosts productivity. If you can save 15 minutes a day for one driver, the system pays for itself 3 times over. This is another feature that supports our company mission: Your Company, Your Way, Any Time, Any Where."

About Clear Computing, Inc.

Clear Computing is the developer of state-of-the-art operations management software for the waste, rental, fuel and service delivery industries. Total Activity Control™ handles day-to-day customer service and financials, including service site management, price lists, work orders, service routes, dispatch, route mapping and optimization, disposal tracking, inventory and more. Clear Computing has led the industry in software enhancements and integration since 1988 with Microsoft Windows-based software, integrated mapping and links to QuickBooks Pro and GPS tracking.
