

# Clear Computing Announces GPS-Relay iPhone App

April 8, 2011

Tinton Falls, NJ - **Clear Computing**, developer of the **Total Activity Control (TAC)** operations management system, today announced their new iPhone App, **GPS-Relay**, which adds location and date/time confirmation to their **Stop-By-Stop Driver Reporting** feature.

GPS-Relay, available at the **iPhone App Store**, takes advantage of the iPhone's location services to send the **driver's latitude, longitude and street address, date and time** and Google map when the driver sent work status information back to the office or /and to your customer to confirm successful completion of service

“This is all part of Clear Computing's strategy to **Go Green with low-cost, easy-to-use features**,” said Joel Smith, Clear Computing Technology Officer. “We already support electronic work order and service route messages between office and drivers. Now, **drivers using the GPS-Relay iPhone app will timestamp their location with every status update they send**. This is a real breakthrough in service verification.”

GPS-Relay is **fast and simple to use**. The driver **just clicks a work status button** in the iPhone email message, and **GPS-Relay automatically opens** with gps coordinates, date and time and map location in the message. In addition, using default application settings for email recipients, GPS-Relay can be used whenever the driver wishes to quickly send a message back to the office, right from the iPhone home screen.

Work Order Email from Office

Driver clicks on status button. GPS-Relay gets email recipient(s), service location and status text from status button.

GPS-Relay opens and adds the data, time, location information and map location to the message

Status Message from Driver

**A full history of driver status information** is maintained in TAC with no extra clerical effort. This history includes the driver's name, location, actual date and time of status message, and status of work with optional text.
